

Reality Hack 2026 | Founder's Lab Prize

Gradient

The personalization layer that empowers people with accessibility needs to dream up any AR application.

Johnny Alan Jack Chris

MISSION & VISION

Democratize AR accessibility by
making technology **adapt to people**
—not the other way around.

"We're not solving a disability problem. We're solving an empowerment problem."

THE PROBLEM

The 1.3 Billion Left Behind

While **everyone can build** with today's AI tools, **those who don't** are people with accessibility challenges. They never get the opportunity to tap into XR—a space that was literally *designed* to benefit them.

Two developers don't write the same code. Two artists don't create in the same medium. **Yet accessibility tools treat 1.3 billion people like they're identical.**

Why Current Solutions Fail

- X** One-size-fits-all settings
Everyone with autism gets the same "autism mode"
- X** Stigmatizing labels
"Special needs" categorization creates barriers
- X** Static configuration
Set once, never adapts to changing contexts
- X** Clinical onboarding
"What's your disability?" instead of "How do you experience the world?"

The Reality of Disability

1 in 31

children have autism (3.2%)

30-40%

of autistic individuals also have ADHD

42-88%

of children with autism have sensory processing issues

Disabilities exist on a spectrum. Solutions should too.

MARKET OPPORTUNITY

TAM / SAM / SOM

Market Validation

OUR SOLUTION

GRADIENT: AI-Powered Personalization

How It Works

- 1 Conversational Onboarding**
"How do you experience the world?"
Non-clinical questions → Structured profile
- 2 AI Classification**
Small LLM reads profile + feature index
Selects relevant capabilities automatically
- 3 Tool Synthesis**
Large LLM generates custom Python agent
Combines: Eye tracking, Camera, Audio, Visual, Nav
- 4 One-Shot Deployment**
Validation loop → Deploy to AR glasses
Tool generation in <30 seconds

What Makes Us Different

Settings menu

Generative tool builder

"What's your disability?"

"How do you experience the world?"

Pre-built accessibility modes

AI dreams up custom solutions

One-size-fits-all

Infinite personalization

Key Insight

People don't want to build "accessibility tools" - they want to build **TOOLS**, period. Every tool should understand them and adapt automatically.

PRODUCT DEMO

The Persona Experience

Primary Use Cases (Optimized For)

1

Sensory Overload Management
Autism, Anxiety

+ Visual clutter reduction via camera analysis

+ Crowd stress detection using eye tracking

+ Calming interventions + quiet space navigation

2

Focus & Attention Tools
ADHD

+ Distraction filtering based on gaze patterns

+ Eye tracking-based focus detection

+ Contextual attention management

3

Guided Intervention
Panic/Stress

+ Research-backed eye movement technique

+ User follows moving dot to regulate stress

+ Raven's unique eye tracking capability

4

Visual Impairment Assistance
Low Vision

+ Scene understanding via camera

+ Audio-based navigation cues

+ Spatial awareness overlays

TECHNOLOGY & INNOVATION

What Makes GRADIENT Unique

Raven Exclusive

Eye Tracking Integration

No other consumer AR glasses have eye tracking.

- + Gaze pattern analysis for stress detection
- + Pupil dilation monitoring for emotional state
- + Gaze-based interaction and attention tracking
- + Guided meditation intervention (follow the dot)

Not Configuration—GENERATION

Generative AI Orchestration

AI builds custom tools, not settings menus.

- + LangGraph workflow for multi-agent coordination
- + Small LLM (classifier) + Large LLM (generator) pipeline
- + Template-based code synthesis with validation loop
- + One-shot generation, not iterative learning

Built Into Core

Anti-Stigma Design Philosophy

Accessibility without the label.

- + No disability categories in the UX
- + Questions about experience, not diagnosis
- + Same customization interface for everyone
- + Accessibility is automatic, not opt-in

Technical Architecture

```
features/  
├─ eye_tracking.py # Gaze, stress detection, meditation  
├─ camera.py # Scene understanding, crowd detection  
├─ audio.py # Calming sounds, TTS, spatial audio  
├─ visual.py # Dimming, desaturation, UI simplification  
├─ navigation.py # Quiet space detection, arrow overlays  
└─ index.json # Feature catalog for AI orchestration
```

PRODUCT DESIGN & UX

Human-Centered Design

Conversational Onboarding

5-10 conversational questions, non-clinical wording:

- Q1** "What environments feel overwhelming to you?"
- Q2** "What tools do you already use? (headphones, brightness, etc.)"
- Q3** "How do you prefer to receive information? (visual, audio, spatial)"
- Q4** "What situations cause you the most stress?"

Multi-Modal Output

- Visual**
 - + Dimming overlay
 - + Reduced clutter
 - + Simplified UI
- Audio**
 - + Calming soundscape
 - + Reduced ambient noise
 - + TTS guidance
- Navigation**
 - + Quiet space detection
 - + Guidance arrows
 - + Spatial cues
- Eye Tracking**
 - + Stress detection
 - + Intervention triggers
 - + Gaze interaction

Design Principles

- 1 Invisible when not needed** — Technology adapts, doesn't intrude
- 2 Progressive disclosure** — Features activate based on context
- 3 Privacy-first** — All processing happens locally on device
- 4 Consistent language** — Design system for generated tools

PRODUCT ROADMAP

Development Timeline

BUSINESS MODEL

Revenue Strategy

B2C: Consumer Subscription

Free 1 generated tool, basic features	\$0/mo
Pro Popular Unlimited tools, all features, priority generation	\$9.99/mo
Family Up to 5 profiles, shared features	\$19.99/mo

B2B: Enterprise Licensing

Per-seat Corporations, educational institutions	\$15-25/user/mo
Enterprise Healthcare systems, government agencies	Custom
Platform API Third-party AR developers	Revenue share

Revenue Projections

Year 1 \$600K 10,000 users	Year 2 \$3.5M 50,000 users	Year 3 \$15M 200,000 users
--	--	--

Unit Economics

AI Compute ~\$0.02-0.05 per tool one-shot, not ongoing	CAC \$15-25 organic + community-driven
LTV \$180+ 18-month average subscription	LTV:CAC 7:1+ strong unit economics

COMPETITIVE ADVANTAGE

Competitive Position

Market Position Matrix

Our Advantage

- Integrating Proven Solutions**
AI builder tools have dominated web dev. We bring that power to XR.
- Unlocking a New Market**
Those who couldn't build before can now create—pushing XR forward.
- Hardware + Software Synergy**
Deep Raven integration creates switching costs and exclusivity.
- Universal Design**
Anyone can use it. Disability or not. No labels, just building.
- We bring proven AI builder tech to XR—unlocking a market that didn't exist.**

THE TEAM

The Builders

Extended Team

- NR

Neuroscience Researcher
Clinical research, accessibility validation, user studies
- HID

Human Interaction Designer
Interaction patterns, usability testing, design research
- XDE

XR Design Engineer
Prototyping, mockup visuals, spatial interfaces

"I have autism. This isn't an abstract problem for us—it's personal."

— Johnny Sheng, Co-founder

We're building what we wish existed.

TRACTION & VALIDATION

Early Signals

Reality Hack 2026

- + Selected for Raven Glass Track
- + Submitting for 3 prize tracks (Raven, XR Health, Founders Lab)
- + Working prototype with live demo capability
- + Deep Raven SDK integration — positioning for SaaS partnership

Research Backing

- + Anti-stigma design increases accessibility adoption (hypothesis under research)
- + Eye movement techniques validated for stress reduction
- + Personalization shown to improve tool adoption rates

Market Validation

1.3B people

globally need assistive technology

Only 10%

currently have access — massive gap

Meta validating

market with Ray-Ban accessibility features

28% cost drop

in components since 2021 — improving margins

Next Steps for Validation

- 1 Raven partnership — become the SaaS layer for their platform
- 2 Post-hack user testing with autism advocacy groups
- 3 Partnership discussions with accessibility organizations
- 4 Pilot program with educational institutions

THE ASK

What We're Looking For

NOW

Immediate (Founders Lab Prize)

\$1,500 prize	Continued development, user testing
Visibility	Pitching at Reality Hack Closing Ceremony
Validation	Credibility for future fundraising

Post-Hackathon

Pre-seed funding	\$250K	12-month runway
Hardware partnerships	Access to next-gen AR devices	
Clinical partnerships	Validation studies with research institutions	
Advisory	Expertise in accessibility, healthcare, AR/VR markets	

Use of Funds (Pre-seed)

Pre-seed Target

\$250K

12-month runway to product-market fit

THE BIGGER PICTURE

Imagine what 1.3 billion people could create.

We're not just building for them. We're letting them build for themselves.

Everyone CAN build.

But those who DON'T are the ones with accessibility challenges.

XR benefits them most.

People with impairments belong in this space—it was made for them.

Let them build their own solutions.

Who better to solve these problems than those experiencing them daily?

No labels. No categories.

Just tools to build, create, and live freely.

1 user
1 tool

10K users
Patterns emerge

100K users
AI improves

1M users
Platform effects

XR was made for people with impairments.
Now they can finally shape it themselves.

"Everyone exists on a **gradient**.
Now everyone can **build** on one
too."

Why GRADIENT Wins

Mission & Vision

Empowering 1.3B people, anti-stigma design, social impact

Problem Definition

Clear pain point with massive underserved market

Market Research

\$30B TAM, validated trends, 10% penetration opportunity

Innovation

Only generative AR accessibility platform

Product Design

Human-centered, experience-based, no stigma

Product Roadmap

Clear phases from MVP to scale

Business Model

B2C subscription + B2B licensing, strong unit economics

Competitive Advantage

Eye tracking, AI pipeline, first-mover, community moat

Team GRADIENT

Reality Hack 2026

Machines that can dream — for those who need it most.
